Supplementary Demonstration Guide

PLANT2CLINIC research team

16 October 2026

Associated manuscript: From Cultivation to Care: Edge IoT, Digital Supervision and Mobile Interfaces for Medicinal-Plant Traceability.

1 Purpose and evidence boundary

This guide identifies the publicly accessible farmer demonstration and the authenticated healthcare demonstration, and explains their relationship to the evaluated edge platform. Videos and screenshots illustrate interfaces and workflows; they do not add field observations, human-subject results, or clinical outcomes to the paper. The public services may change after the inspection date.

2 Farmer demonstration

The interactive application is at `https://agricultor.calidadgacp.com/`. The public video collection is at `https://agricultor.calidadgacp.com/videos/serie-argentina/`. The interface currently uses the name cannabisIA; local development materials also use Mi Cultivo.

1. **Video 1: Field registration** (`01-registro-en-campo.mp4`). Illustrates recording an activity in the field and associating it with a lot. The video is explanatory, not a timed user experiment.
2. **Video 2: Mobile traceability** (`02-trazabilidad-movil.mp4`). Illustrates the lot history and mobile production workflow.
3. **Video 3: Optional IoT adaptation** (`03-adaptacion-iot.mp4`). Illustrates the intended use of sensors and actuators. The mobile IoT view displays simulated values; the quantitative field-monitoring results belong to the central platform.
4. **Video 4: Optional AI assistance** (`04-asistente-ia-gacp.mp4`). Illustrates access to approved procedures with technical supervision. The mobile demonstrator uses prepared examples; it is not the local-model benchmark reported in the manuscript.

The fifth public video explains local Argentine regulatory context. It is retained in the author's working materials but is not included as a technical research supplement. All four supplied videos use Spanish narration; the descriptions above provide an English content summary. Each supplied file has a corresponding still image.

3 Healthcare demonstration

The application is at `https://pruebas.plant2clinic.com/`. Individual evaluation access may be requested from the corresponding author; account credentials are not included in this guide. The

live inspection used an authorized healthcare role and viewed the empty participant list and blank first-interview form without creating a participant or saving an interview.

The inspected interface explicitly identifies itself as a fictitious-data test environment. It supports protocol-defined interview fields and a response sheet referring to an externally authorized questionnaire. No dose recommendation or automatic clinical interpretation was tested. Product management and other roles are described in the supplied technical documentation but were not exercised in this walkthrough.

For reviewers, the suggested read-only sequence is: sign in with an individually issued account; inspect the participant overview; open the blank first-interview form; observe the separation between protocol inputs and product assignment; cancel without saving. Authorized functional trials should use an isolated test dataset and are outside this paper's interface inspection.

4 Version separation

Health2Clinic technical documentation 0.2.1 and the training manual 0.3.0 describe successive releases. The earlier PLANT2CLINIC RCT module in the main supplement is a different prototype. Its agents, randomization method, and unblinding procedures must not be attributed to Health2Clinic without version-specific verification.

5 Central platform and production replica

The production stack links MQTT telemetry, local IoT storage, room policies, batch passports, and QA review. A documented production-to-replica copy supplies the supervision node, with direct MQTT ingestion disabled in that replica. This establishes a copied inspection environment, not measured real-time synchronization or validated predictive-twin behaviour. The article's dashed architectural links to the mobile demos identify proposed integration that remains to be tested.

6 Archival and access note

The supplied videos are retained copies of local project files. The quantitative evaluation records are separate from these demos. Neither a changing demonstration URL nor a password-protected application substitutes for the archival data deposit required by the journal. Credentials, institutional internal manuals, and the internal operational database are excluded from the submission packages.
